

1 ABSTRACT

2 The present invention relates to a method for
3 producing patient specific anti-cancer antibodies using a
4 novel paradigm of screening.. By segregating the anti-cancer
5 antibodies using cancer cell cytotoxicity as an end point,
6 the process makes possible the production of anti-cancer
7 antibodies customized for the individual patient that can be
8 used for therapeutic and diagnostic purposes. The invention
9 further relates to the process by which the antibodies are
10 made and to their methods of use. The antibodies can be made
11 specifically for one tumor derived from a particular patient
12 and are selected on the basis of their cancer cell
13 cytotoxicity and simultaneous lack of toxicity for non-
14 cancerous cells. The antibodies can be used in aid of
15 staging and diagnosis of a cancer, and can be used to treat
16 tumor metastases.. The anti-cancer antibodies can be
17 conjugated to red blood cells obtained from that patient and
18 re-infused for treatment of metastases based upon the
19 recognition that metastatic cancers are usually well
20 vascularized and the delivery of anti-cancer antibodies by
21 red blood cells can have the effect of concentrating the
22 antibodies at the site of the tumor.
